

# *Furnace Maintenance DID YOU KNOW?*

- ***Change your filter once a month.***

A dirty filter will decrease the airflow and prevent the furnace from working efficiently, which will increase the fuel/energy consumption and result in a higher heating bill. There can also be damage to the motor.

- ***Install a programmable thermostat.***

By using pre-programmed settings on your thermostat, you can save energy by not heating your home when you're not at home or setting back the thermostat during the sleeping hours.

- ***Check your heating vents.***

Ensure that your vents are not obstructed by furniture or other items. Keeping heating vents clear will promote an even heat flow through the house.

- ***Keep your outdoor exhaust vents clear of snow and ice in the winter.***

A blocked exhaust fan can cause carbon monoxide fumes to back up into the house.
